■ BLOCK DIAGRAM

■ PIN DESCRIPTION

VIN - Power supply input pin. Bypass with a 1 μ F capacitor to GND

GND - Ground.

EN - Active High Shutdown Input.

VOUT - Regulator Output pin. Sources up to 150 mA.

BP - Bypass pin. It should be connected to external 0.1nF capacitor to GND to reduce output noise.

■ DETAILED DESCRIPTION OF TECHNICAL TERMS

DROPOUT VOLTAGE (V_{DROP})

The dropout voltage is defined as the difference between input voltage and output voltage at which point the regulator starts to fall out of regulation. Below this value, the output voltage will fall while the input voltage is reduced. It depends on the load current and junction temperature. The dropout voltage is specified at which the output voltage drops 100mV below the value measured with 1V difference.

LINE REGULATION

Line regulation is the ability of the regulator to maintain a constant output voltage as the input voltage changes. The line regulation is specified as the input voltage is changed from $V_{IN} = V_{OUT} + 1\text{ V}$ to 6V and $I_{OUT} = 1\text{ mA}$.

LOAD REGULATION

Load regulation is the ability of the regulator to maintain a constant output voltage as the load current changes. To minimize temperature

effects, it is a pulsed measurement with the input voltage set to $V_{IN} = V_{OUT} + 1\text{ V}$. The load regulation is specified under the output current step of 0.1mA to 150mA.

CURRENT LIMIT (I_{IL})

The AIC1746 includes a current limiting, which monitors and controls the maximum output current if the output is shorted to ground. This can protect the device from being damaged.

THERMAL PROTECTION

The thermal sensor protects the device when the junction temperature exceeds $T_J = +150^\circ\text{C}$. It signals, the shutdown logic, turning off the pass transistor and allowing the IC to cool. Thermal protection is designed to protect the device in the event of fault conditions. For continuous operation do not exceed the absolute maximum junction-temperature rating of $T_J = 150^\circ\text{C}$, or damage the device.

■ APPLICATION INFORMATION

INPUT-OUTPUT CAPACITORS

Linear regulators require input and output capacitors to maintain stability. Input capacitor at 1 μ F with 1 μ F output capacitor is recommended.

POWER DISSIPATION

The AIC1746 obtains thermal-limiting circuitry, which is designed to protect the device against overload condition. For continuous load condition, maximum rating of junction temperature must not be exceeded. It is important to pay more attention in thermal resistance. It includes junction to case, junction to ambient. The maximum power dissipation of AIC1746 depends on the thermal resistance of its case and circuit board, the temperature difference between the die junction and ambient air, and the rate of airflow. The rate of temperature rise is greatly affected by the mounting pad configuration on the PCB, the board material, and the ambient temperature. When the IC mounting with good thermal

conductivity is used, the junction temperature will be low even when large power dissipation applies.

The power dissipation across the device is

$$P = I_{OUT} (V_{IN} - V_{OUT}).$$

The maximum power dissipation is:

$$P_{MAX} = \frac{(T_{J-max} - T_A)}{R\theta_{JA}}$$

Where T_{J-max} is the maximum allowable junction temperature (150°C), and T_A is the ambient temperature suitable in application.

As a general rule, the lower temperature is, the better reliability of the device is. So the PCB mounting pad should provide maximum thermal conductivity to maintain low device temperature. GND pin performs a dual function for providing an electrical connection to ground and channeling heat away. Therefore, connecting the GND pin to ground with a large pad or ground plane would increase the power dissipation and reduce the device temperature.
