Board No.: IL2985-ILDC11-01

About This Evaluation Board

This Evaluation Board provides a complete isolated 5-volt RS-485 node using an IL2985E low-power transceiver and an ILDC11-15E ultraminiature isolated DC-DC convertor. The 4 by 3 inch (100 by 75 mm) board provides screw terminal and test point connections.

The IL2985E is a low-power, fully-isolated, differential 5-volt bus transceiver. The ILDC11-15E isolates the 3.3-volt controller supply, and a boost regulator provides a five-volt fully-isolated bus supply.

The IL2985E transceiver has current limiting and thermal shutdown features protect against RS-485 short circuits and bus contention that may cause excessive power dissipation. RS-485 inputs feature a “fail-safe if open” design, ensuring a logic high R-output if A/B are floating. The ILDC11-15E DC-DC convertor has frequency hopping and shielding to minimize EMI.

Both devices use NVE’s unique ceramic/polymer composite barrier to provide full isolation and virtually unlimited barrier life.

IL2985E Specification Highlights

- Very low quiescent current (2.4 mA typ. $IDD1Q + IDD2Q$)
- 3 V to 5 V controller; 5 V bus voltages
- 4 Mbps
- 2500 V_{RMS} isolation voltage
- 7 kV bus ESD protection
- Thermal shutdown protection
- -40 °C to +85 °C temperature range

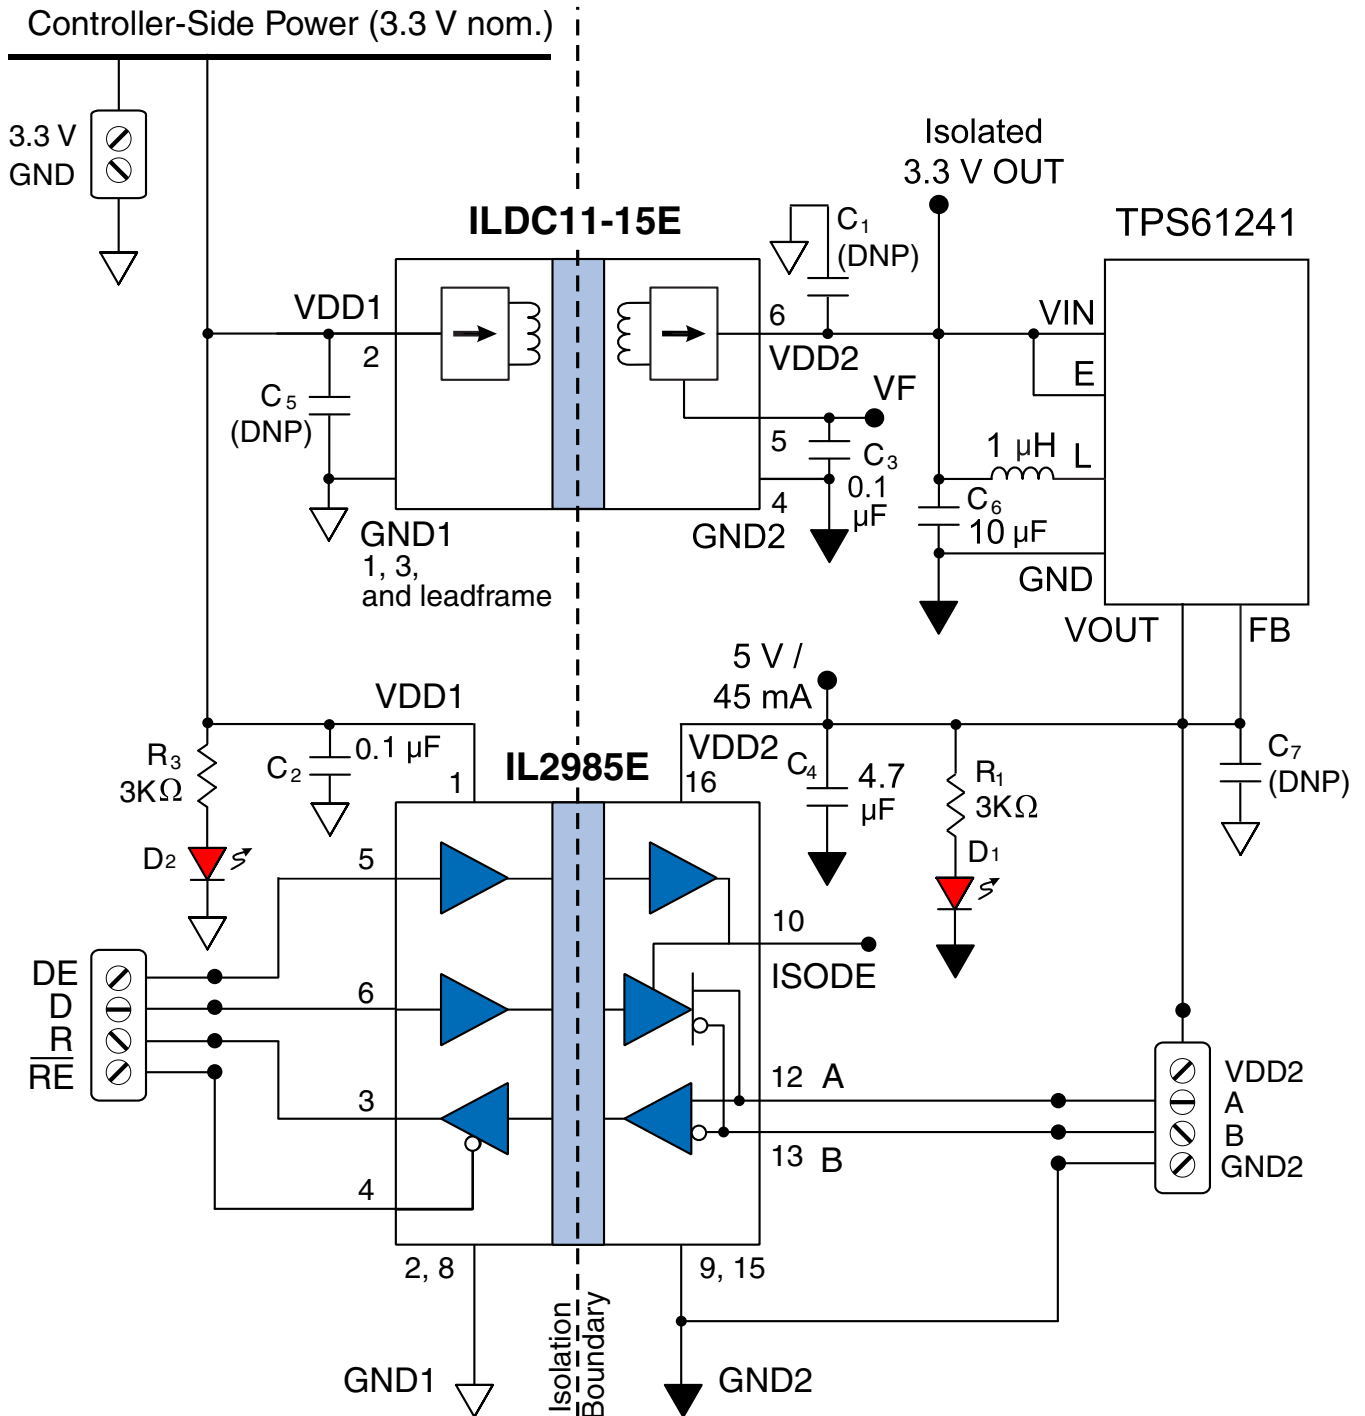

ILDC11-15E Specification Highlights

- Ultraminiature 3 mm x 5.5 mm DFN package
- 3.3 V input to 3.3 V output
- Quarter watt output power
- Fully-regulated output
- Short-circuit protection
- No minimum load
- 2500 V_{RMS} isolation voltage
- Low EMI without ferrite beads
- -40 °C to 125 °C temperature range

Quick Start

- Connect V_{DD1} to a 3.3 V power supply.
- The two LEDs should indicate input power and output power from the DC-DC convertor.
- Connect a square-wave signal to the “D” input with an amplitude of 2.4 to 3.3 V.
- Look for the complementary “A” and “B” outputs on an oscilloscope.

	TE Connectivity	282834-2	TERM BLK 2P SIDE ENT 2.54MM P

Board Layout

Bypass Capacitors

Bypass capacitors should be placed as close as possible to the transceiver supply pins, and a 10 μ F output-side bypass capacitor should be close to the DC-DC convertor VDD2 pin.

Maintaining Creepage

The ILDC11 has 3.5 mm clearance between isolated pads. Creepage distances are often critical in isolated circuits. Therefore power planes should be spaced to avoid compromising creepage, and board pads should not extend past the part pads to avoid compromising creepage.

Thermal Management

The ILDC11 is rated to 125 °C operating temperature with a 175 °C maximum junction temperature. Since this evaluation board is limited to the IL2985E's 85 °C maximum operating temperature, a simple, double-sided PCB can be used. Two-ounce (70 μ m) copper and thermal vias were used to improve thermal performance. The thermal vias are shown on the "Evaluation Board Layers" page.

For high-temperature applications a double-sided, double buried power plane ("2s2p") board with thermal vias minimize the ILDC11 temperature rise. Even if not necessary to avoid the maximum junction temperature, a 2s2p board will reduce temperature rise and therefore improve the thermal stability of the DC-DC convertor output voltage in critical applications.

Application Information

Inherently Low EMI

IL4685E Transceivers are fully compliant with generic EMC standards EN50081, EN50082-1 and the umbrella line-voltage standard for Information Technology Equipment (ITE) EN61000.

The DC-DC convertor oscillator operates above 88 MHz, where emission limits are higher since there is less risk of interference with common commercial radio and television broadcasting.

Frequency-hopping technology dramatically reduces peak EMI, and synchronous rectification and PWM control are avoided, resulting in inherently low EMI. Ferrite beads are generally not required for EMI mitigation.

High Magnetic Immunity

The IL2985E's Wheatstone bridge configuration and differential magnetic field signaling ensure excellent EMC performance against all relevant standards.

Power Management

Here are some tips to avoid overtaxing the DC-DC convertor:

Use a low-power transceiver

Transceivers such as the NVE IL2985E use less bus power than other transceivers.

Eliminate termination resistors

Termination resistors minimize reflections, which can be important for long cable lengths. However, these resistors dramatically increase output drive current and may be unnecessary for short cables and low speeds.

Avoid “fail-safe” resistors

Because the IL2985E has internal “fail-safe” resistors, external “fail-safe” pull-up and pull-down bias resistors are unnecessary and use power.

Isolated RS485 / RS422 Transceivers

NVE offers a wide choice of isolated RS-485 and RS-422 network transceivers.

Versions are available in 0.15-inch and 0.3-inch SOIC packages, as well as ultraminiature QSOP packages. QSOP and 0.15-inch SOIC package are the most compact solutions in the world.

Standard isolation voltage is 2.5 kV_{RMS}, and ultrahigh-voltage V-Series versions have 6 kV_{RMS} isolation voltage.

The IL4685 and IL4622 combine isolated transceivers with integrated DC-DC convertors.

Limited Warranty and Liability

Information in this document is believed to be accurate and reliable. However, NVE does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. In no event shall NVE be liable for any indirect, incidental, punitive, special or consequential damages (including, without limitation, lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Right to Make Changes

NVE reserves the right to make changes to information published in this document including, without limitation, specifications and product descriptions at any time and without notice.

Use in Life-Critical or Safety-Critical Applications

Unless NVE and a customer explicitly agree otherwise in writing, NVE products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical devices or equipment. NVE accepts no liability for inclusion or use of NVE products in such applications and such inclusion or use is at the customer's own risk. Should the customer use NVE products for such application whether authorized by NVE or not, the customer shall indemnify and hold NVE harmless against all claims and damages.

Applications

Applications described in this document are illustrative only. NVE makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NVE products, and NVE accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NVE product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customers. Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NVE does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customers. The customer is responsible for all necessary testing for the customer's applications and products using NVE products in order to avoid a default of the applications and the products or of the application or use by customer's third party customers. NVE accepts no liability in this respect.
